Political areas, such as State Capitols are also areas to avoid.

NOTE: During crisis periods, military convoys and emergency vehicles will have the right-of-way and your travel around these areas may be restricted.

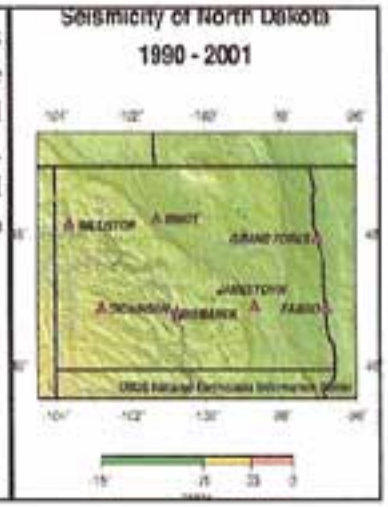
Seismic activity in North Dakota has been minimal. Minor tremors have been felt but the epicenters could mostly be traced outside of the state. Dishes rattling, beds swaying, and loud noises like thunder were reported. No deaths or injuries have been reported.



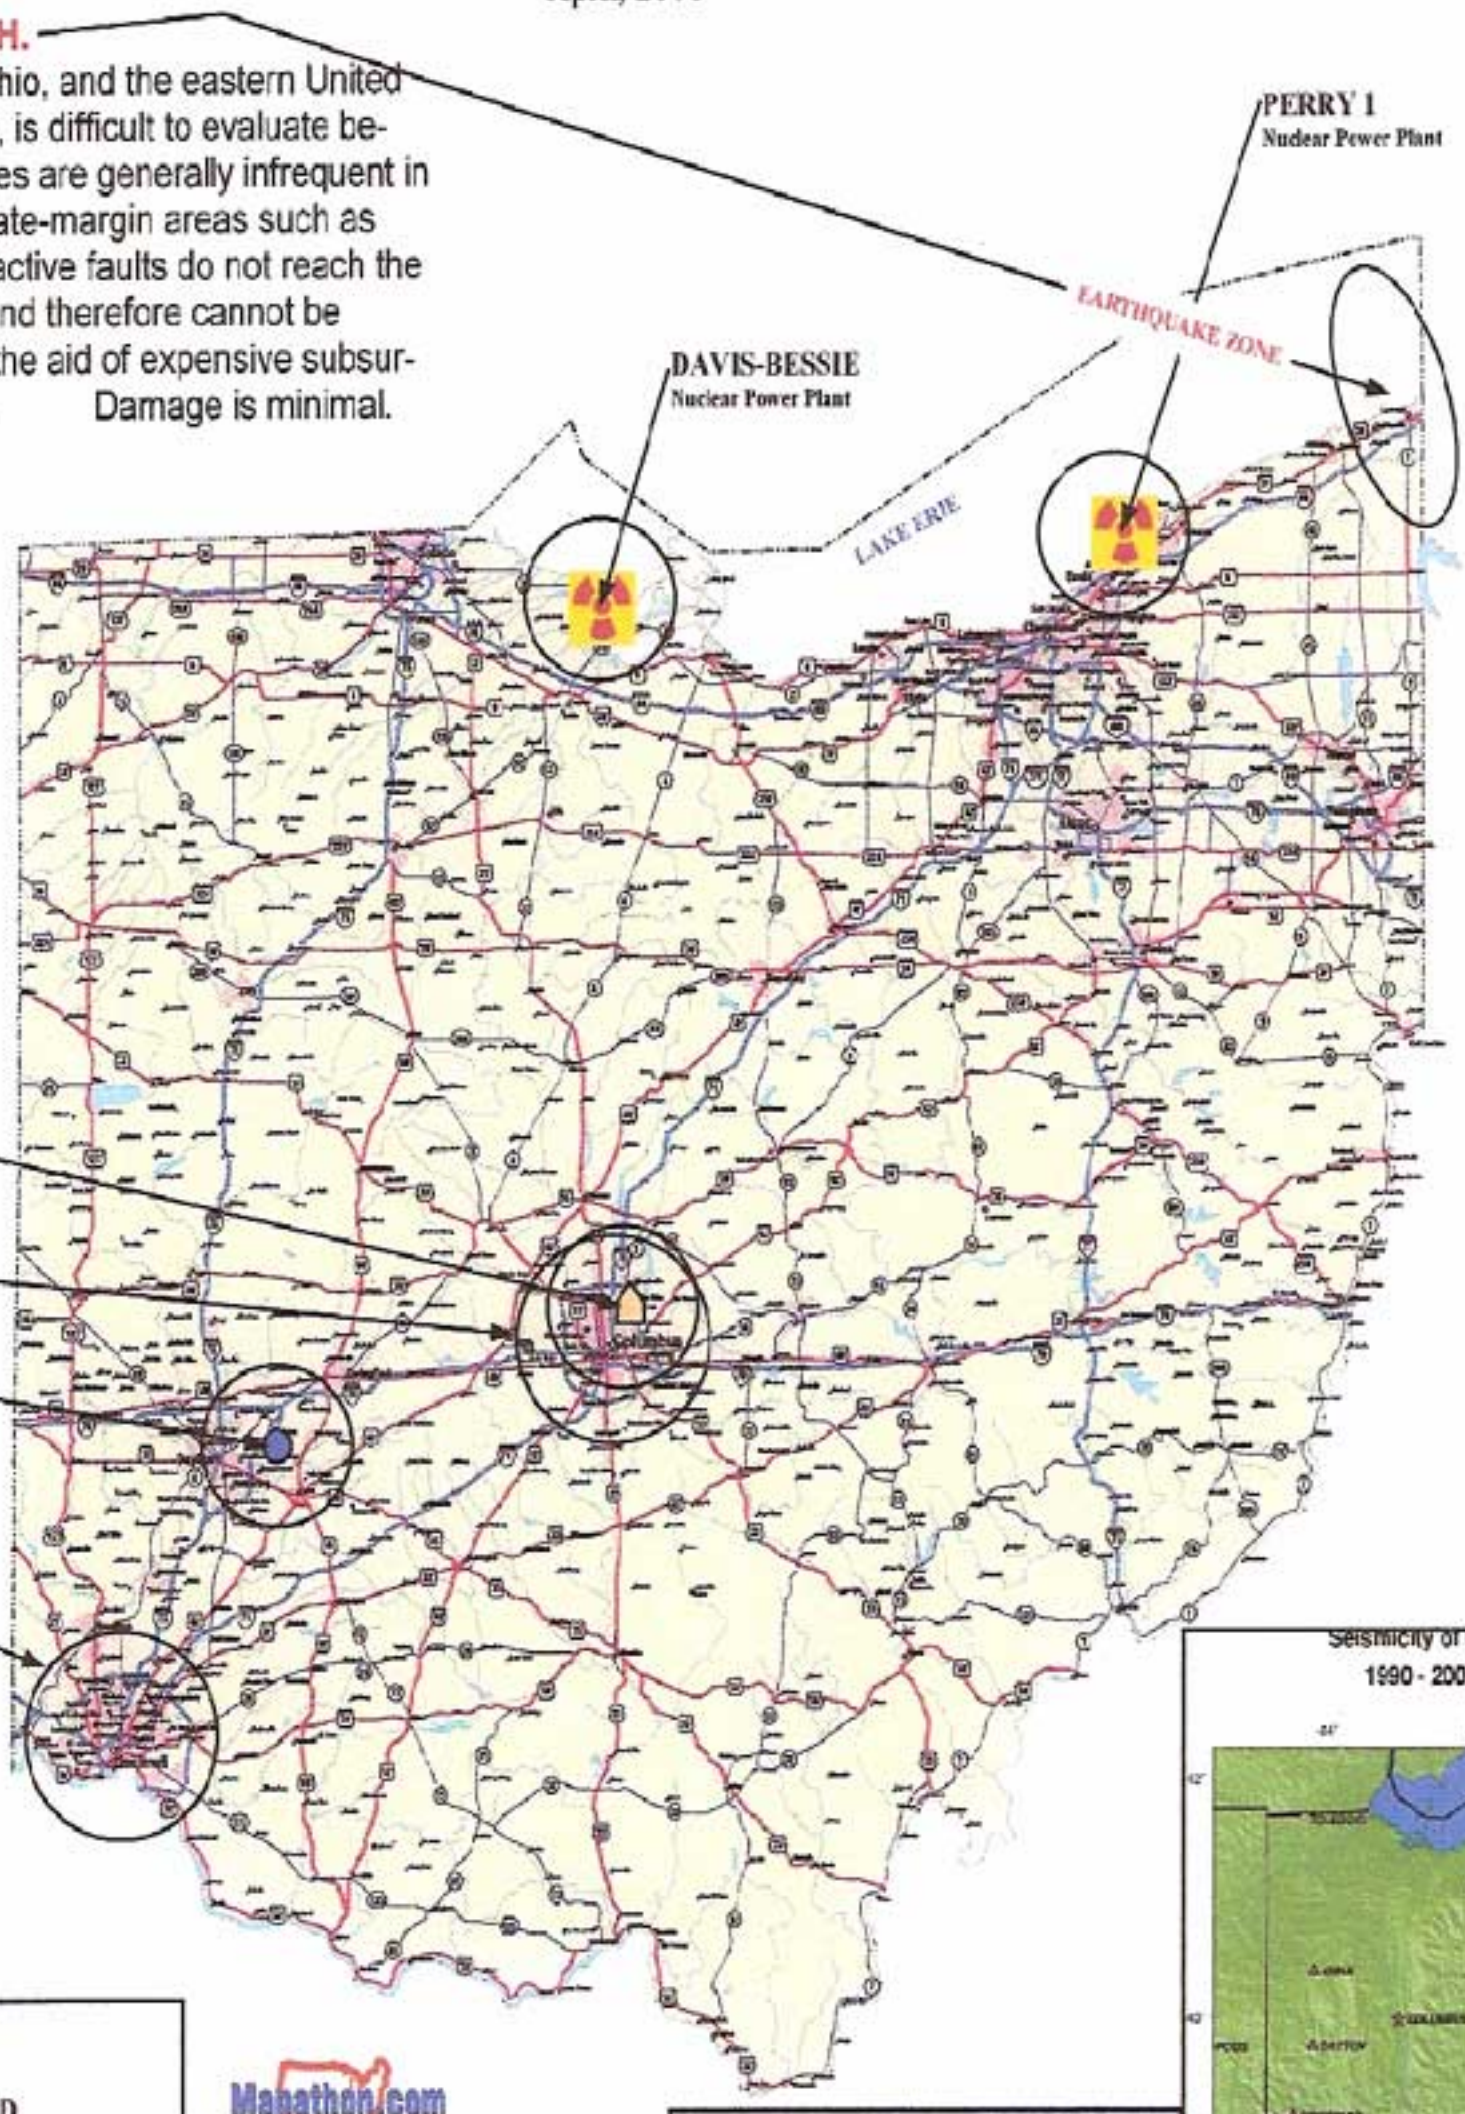
RogueTurtle's Threat Analysis

OHIO

April, 2006

ASHTABULA, OH.

Seismic risk in Ohio, and the eastern United States in general, is difficult to evaluate because earthquakes are generally infrequent in comparison to plate-margin areas such as California. Also, active faults do not reach the surface in Ohio and therefore cannot be mapped without the aid of expensive subsurface techniques. Damage is minimal.



Earthquakes of the past limited damage to falling chimneys, cracked plaster and "swinging chandeliers". No deaths or injuries have been reported, despite the proximity of the Ashtabula Zone.

RogueTurtle's Threat Analysis
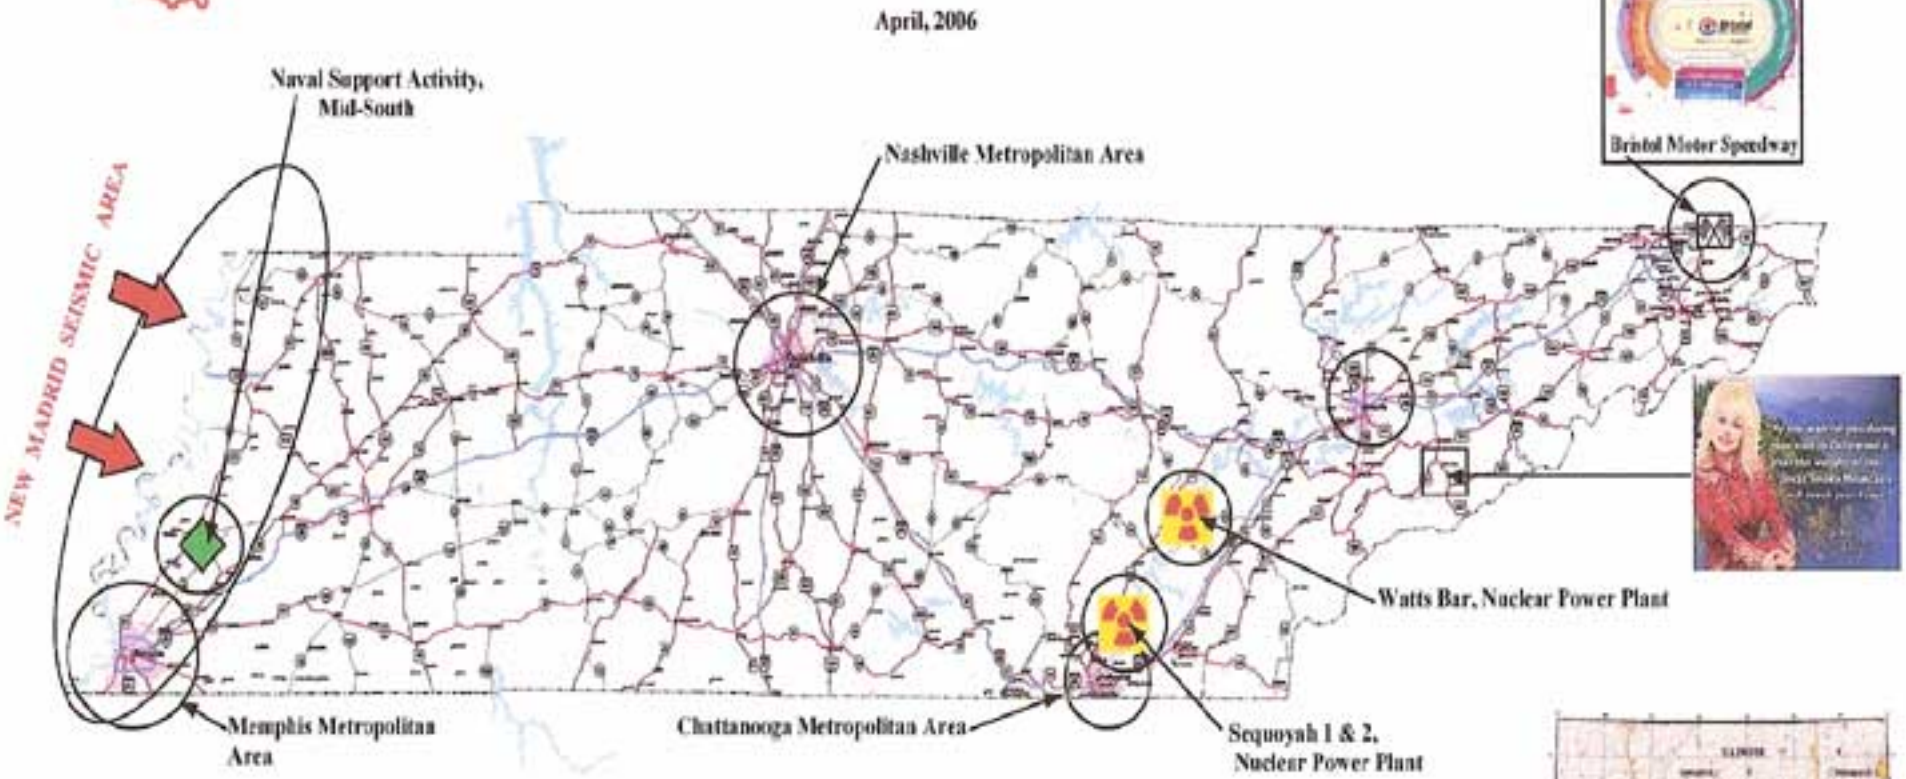
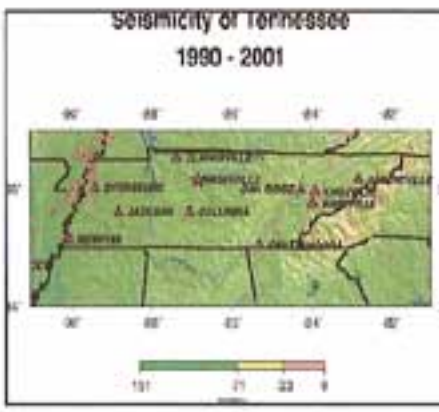
TENNESSEE

April, 2006





Seismic activity is moderate to severe in the vicinity of the New Madrid fault (see map, right). At the convergence of 5 states, all fall within the effects of earthquake activity. In Tennessee, major fissures opened, lakes and land areas rose and fell, and landslides were reported. No loss of life was reported but many buildings were damaged throughout the area.

Seismic activity continues in the region of Western Tennessee, but at a lower scale than the great New Madrid Earthquake of 1811-1812.

I would rate the threat in Western Tennessee as "Moderate", but "Low" for the Central and Eastern parts of the state. The farther away you are from the New Madrid fault, the better off you will be.
